

# VLQ searches and hadronic final states in the ATLAS experiment

11th Large Hadron Collider Physics Conference

---

**Venugopal Ellajosyula**

On behalf of the ATLAS collaboration

May 23, 2023

Uppsala University

- Introduction to vector-like quarks and minimal Composite Higgs Models
- **Pair-production:**
  - Pair-produced vector-like top and bottom partners in events with large  $E_T^{\text{miss}}$  [arxiv:2212.05263](#)
  - Pair-production of vector-like quarks with at least one leptonically decaying  $Z$  boson and a  $3^{\text{rd}}$  generation quark [arxiv:2210.15413](#)
- **Single-production:**
  - Search for singly produced vector-like top partners in multilepton final states [ATLAS-CONF-2023-020](#)
  - Search for single production of vector-like  $T$  quarks decaying into  $Ht$  or  $Zt$  [arXiv:2305.03401](#)

This list is not exhaustive. A complete list of analyses with the full Run-2 data collected by ATLAS can be found [here](#).

# What are VLQs?

Vector-like fermions,  $\psi$ , have left- and right-handed chiralities that transform in the same way under the SM gauge group

$$SU(3)_C \times SU(2)_L \times U(1)_Y$$

- Only left-handed charged currents for SM quarks:

$$J^{\mu+} = J_L^{\mu+} = \bar{u}_L \gamma^\mu d_L = \bar{u}_L \gamma^\mu (1 - \gamma^5) d \rightarrow V - A$$

- **BOTH** left- and right-handed charged currents for VLQs:

$$J^{\mu+} = J_L^{\mu+} + J_R^{\mu+} = \bar{u}_L \gamma^\mu d_L + \bar{u}_R \gamma^\mu d_R = \bar{u} \gamma^\mu d \rightarrow V$$

Additionally, gauge-invariant mass terms,  $-M\bar{\psi}\psi$ , allowed without the need of Higgs.

# Composite-Higgs models and vector-like quarks

- The Higgs boson is a composite pseudo-Nambu-Goldstone boson (pNGB) from spontaneous breaking of a global symmetry in a new strongly coupled sector  
→ This protects the Higgs mass.
- Models with partial compositeness predict **new vector-like fermions**.
- Simplest extensions with VLQ ( $T^{2/3}$ ,  $B^{-1/3}$  and  $X^{5/3}$ ) singlets, doublets, and triplets.
- VLQs assumed to decay via **charged and neutral currents** to 3rd generation quarks.

- **QCD pair-production:** Mass-independent, dominant at low mass
- **Single-production:** Scales with coupling, model dependent, significant at high mass.

# Pair-Production

---

# Pair-produced vector-like top and bottom partners in events with large $E_T^{\text{miss}}$

arxiv:2212.05263

- Vector-like  $T^{2/3}$ ,  $B^{-1/3}$ , and  $X^{5/3}$  considered
- Events characterized by **low lepton-multiplicity, high jet-multiplicity, and large  $E_T^{\text{miss}}$**
- Dominant backgrounds:  $t\bar{t}$  and  $W$ +jets  
⇒ reduced using **cuts on transverse mass**
- At least one top quark from the signal expected to have a high  $p_T$   
⇒ **requirement on large-R jets**
- **Neural networks** used to discriminate between signal and background  
⇒ Input variables such as high  $m_{\text{eff}}$  for VLQ mass, properties of large-R jets,  $b$ -jet multiplicity, transverse mass etc. used
- The search uses  $139 \text{ fb}^{-1}$  data collected with the ATLAS detector

# Examples of discriminating variables

# Results

VLQ	Scenario	Obs. limit (TeV)
$T(B)$	Singlet	1.26 (1.33)
$T$	$(T, B)$ or $(X, T)$ doublet	1.41
$B/X$	$(T, B)$ or $(X, T)$ doublet or $B(B/X) \rightarrow Wt = 100$	1.46
$T/B/X$	$(T, B)$ or $(X, T)$ doublet mass-degenerate	1.59

- No significant excesses
- Analysis most sensitive to the  $T \rightarrow Zt$  and  $B \rightarrow Wt$  decay modes
- **Strongest limits for the  $(T, B)$  and  $(X, T)$  when  $m_X = m_T = m_B$  are at 1.59 TeV**

# Pair-production of vector-like quarks with at least one leptonically decaying $Z$ boson and a 3<sup>rd</sup> generation quark

arXiv:2210.15413

- Optimized for decays to a leptonically-decaying  $Z$  boson and a third generation SM quark.
- Events characterized by high- $p_T$   $Z$  boson,  $b$ -tagged jets, high- $p_T$  large- $R$  jets, exactly  $2\ell$  or  $\geq 3\ell$ , boosted  $W, Z, H$ , and  $t$ .
- Categorization done using a **neural-network based boosted object tagger**.

# Multi-Class Boosted Object Tagger (MCBOT)

- Large-R jets reclustered from calibrated  $R=0.4$  jets used as input to MCBOT to identify hadronically decaying  $V$ ,  $H$ , and top quark.
- Based on **multi-class DNN trained using RC jets** from  $Z' \rightarrow t\bar{t}$ ,  $W' \rightarrow WZ$ , and KK-graviton  $\rightarrow hh$  simulations, with multijet as background.
- Three signal labels ( $V$ ,  $H$ , top) are obtained by matching the RC jet to the corresponding boson or top quark at generator-level within  $\Delta R < 0.75$ .

# Results

Model	Observed (Expected) Mass Limits [TeV]		
	$2\ell$	$3\ell$	Combination
$T\bar{T}$ Singlet	1.14 (1.16)	1.22 (1.21)	1.27 (1.29)
$T\bar{T}$ Doublet	1.34 (1.32)	1.38 (1.37)	1.46 (1.44)
100% $T \rightarrow Zt$	1.43 (1.43)	1.54 (1.50)	1.60 (1.57)
$B\bar{B}$ Singlet	1.14 (1.21)	1.11 (1.10)	1.20 (1.25)
$B\bar{B}$ Doublet	1.31 (1.37)	1.07 (1.04)	1.32 (1.38)
100% $B \rightarrow Zb$	1.40 (1.47)	1.16 (1.18)	1.42 (1.49)

- No significant excesses
- Combined results **exclude T masses upto 1.27 and 1.46 TeV** for singlet and doublet configurations
- Combined results **exclude B masses upto 1.20 and 1.32 TeV** for singlet and doublet configurations
- These limits are better than the previous searches by more than 200 GeV.

# Single-production

---

# Search for singly produced vector-like top partners in multi-lepton final states ATLAS-CONF-2023-020

- Optimized for **vector-like quarks decaying to Z bosons** which further decays to a pair of electron or muons
- Characterized by the presence of a **pair of opposite-sign dileptons, b-jets, and forward jets**
- **Two final states (2 $\ell$  and 3 $\ell$ )** optimized independently
- Analysis uses 139 fb<sup>-1</sup> data collected with the ATLAS detector
- Improvements compared to previous iteration of this search are mainly from **more data, better kinematic selections, and more efficient top-tagging**

# Signal topology

- Signal expected to have high energy objects, including  $Z$  boson and boosted top quark
- Forward jets scattering off of a heavy, off-shell vector boson from one of the incoming partons
- Angular separation between  $Z$  and top quark expected to be high

# Results

- No significant excesses
- Limits on cross-sections reinterpreted in the coupling-mass, and width-BR planes
- Only singlet case shown here
- **Coupling,  $\kappa$ , between 0.22 and 0.64 excluded for masses between 1000 and 1975 GeV**
- Doublet exclusions slightly weaker

# Search for single production of vector-like $T$ quarks decaying into $Ht$ or $Zt$ [arXiv:2305.03401](https://arxiv.org/abs/2305.03401)

- Analysis targets final states with **1 $\ell$ , multiple jets and b-jets** using  $139 \text{ fb}^{-1}$  data collected with the ATLAS detector
- Presence of **boosted resonance** used to discriminate between signal and background
- **Wide range of couplings** of the VLQ to  $W, Z$  and  $h$  bosons probed
- Improvements of  $\sim 1.6x$  in the exclusion limits of the coupling compared to previous search thanks to **more data, better kinematic selections, improved top-tagging**

# Signal topology

- Major backgrounds:  $t\bar{t}$ , single top,  $V$ +jets
- Several high energy objects from decay of VLQ  
 $\Rightarrow$  high  $m_{eff}$  + boosted jets from top quark,  $W/Z$ /Higgs bosons
- Presence of forward jets
- Target signal categories:  $T(\rightarrow Zt)qb$ ,  $T(\rightarrow Ht)qb$ ,  $T(\rightarrow Zt)qt$ ,  $T(\rightarrow Zt)qt$   
 $\Rightarrow$  Requirements on object multiplicities for different SRs

# Results

- No significant excess
- Upper limits on cross-section, universal coupling ( $\kappa$ ), and relative couplings to  $W, Z, \text{Higgs}$
- **Singlet case:**  $m_T < 2.1 \text{ TeV}$  excluded for  $\kappa > 0.6$
- **Doublet case:**  $m_T < 1.68 \text{ TeV}$  excluded for  $\kappa > 0.75$

## Summary

- Vector-like quarks predicted by several models including CHMs
- Searches presented in this talk consider the minimal CHMs with three types of VLQs,  $T^{2/3}$ ,  $B^{-1/3}$ , and  $X^{5/3}$  decaying to SM
- Searches for third generation vector-like quarks produced singly and in pairs presented here
- No significant excesses seen but several new and innovative methods were developed
- Limits on the masses with more data and newer methods stronger than before.

# Search for singly produced vector-like top partners in multi-lepton final states

ATLAS-CONF-2023-020

# Dilepton channel

	2 $\ell$ CR1	2 $\ell$ CR2	2 $\ell$ CR3	2 $\ell$ VR1	2 $\ell$ VR2	2 $\ell$ SR
Preselection	1 pair of OS-SF leptons with $ m(\ell\ell) - m_Z  < 10$ GeV $p_T(\ell\ell) > 200$ GeV, $H_T > 300$ GeV $\geq 1$ vRC jet $H_T + E_T^{\text{miss}} < m_{\ell\ell}$					
forward jets	$\geq 1$	0	0	$\geq 1$	0	$\geq 1$
$b$ -tagged jets	0	$\geq 1$	0	0	$\geq 1$	$\geq 1$
top-tagged jets	-	-	$\geq 1$	$\geq 1$	$\geq 1$	$\geq 1$
top-vetoed jets	$\geq 1$	$\geq 1$	-	-	-	-

- Dominant backgrounds from  $Z$ +jets, and smaller contribution from  $VV$  and  $t\bar{t}$
- Signal expected to have high energy objects, including  $Z$  boson and top quark
  - Requirements on  $p_T(\ell\ell)$  and  $H_T$
  - Require atleast one variable radius reclustered (vRC) jet originating from the boosted top quark
- Mass of the VLQ reconstructed using the  $Z$  boson candidate, and the leading vRC jet
- Forward jets scattering off of a heavy, off-shell vector boson from one of the incoming partons also expected

# Dilepton channel

- Signal expected to have high energy objects, including  $Z$  boson and top quark
  - Requirements on  $p_T(\ell\ell)$  and  $H_T$
  - Require atleast one variable radius reclustered (vRC) jet originating from the boosted top quark
- Mass of the VLQ reconstructed using the  $Z$  boson candidate, and the leading vRC jet
- Forward jets scattering off of a heavy, off-shell vector boson from one of the incoming partons also expected

# Trilepton channel

	3 $\ell$ VV	3 $\ell$ Mixed	3 $\ell$ ttX	3 $\ell$ VR	3 $\ell$ SR
Preselection	$\geq 3$ leptons $\geq 1$ pair of OS-SF leptons with $ m(\ell\ell) - m_Z  < 10$ GeV				
$b$ -tagged jets	0	1	$\geq 2$	$\geq 1$	$\geq 1$
forward jets	-	0	0	$\geq 1$	$\geq 1$
$\Delta\phi$ selections	-	$\Delta\phi(Z, \ell_3) < 2.6$	$\Delta\phi(Z, \ell_3) < 2.6$	$\Delta\phi(Z, \ell_3) < \frac{\pi}{2}$ OR $\Delta\phi(Z, b_{lead}) < \frac{\pi}{2}$	$\Delta\phi(Z, \ell_3) > \frac{\pi}{2}$ AND $\Delta\phi(Z, b_{lead}) > \frac{\pi}{2}$
other selections	-	-	-	-	$\max(p_T(\ell)) > 200$ GeV $p_T(\ell\ell) > 300$ GeV $H_T \cdot n(\text{jets}) < 6$ TeV

- Dominant background sources are  $VV$ ,  $ttV$ ,  $ttH$
- Similar to the  $2\ell$  channel,  $b$ -jets and forward jets are expected, in addition to high  $p_T$  objects such as the  $Z$  boson and top quark
- Angular separation between  $Z$  and top quark expected to be high
  - Additional requirements on  $\Delta\phi(Z, \ell_3)$  and  $\Delta\phi(Z, b_{lead})$

# Trilepton channel
